

| Paper: 1MA1/1H |         |        |      |                                                                                                        |
|----------------|---------|--------|------|--------------------------------------------------------------------------------------------------------|
| Question       | Working | Answer | Mark | Notes                                                                                                  |
| 21             |         |        | C1   | states (angle) $ABC = (\text{angle}) BCD$                                                              |
|                |         |        | C1   | states 2 <sup>nd</sup> link $AB = CD$                                                                  |
|                |         |        | C1   | states 3 <sup>rd</sup> link with reason: $BC = BC$ (common)                                            |
|                |         |        | C1   | concludes proof by stating (triangle) $ABC \equiv (\text{triangle}) DCB$ with reason SAS and $AC = BD$ |
