Question	Working	Answer	Mark	Notes		
28		Shows reasoning to reach $y=3$	M1	forms equation eg $2x + 6 = 5x - 9$	$48 \div 3$ (=16)	$3(2x + 6) = 48$ **or** $3(5x - 9) = 48$, condone missing bracket
			M1	isolates x and number terms $3x = 15$	forms equation $2x+6=$"16" **or** $5x - 9=$ "16"	Isolates x and number terms $6x =$ "30" **or** $15x =$ "75"
			M1	substitutes "5" into side length eg $2 \times 5 + 6$ (=16)	isolates x and number terms $2x=$ "10" **or** $5x =$ "25"	forms the second equation
			A1	$48 \div 16=3$ **or** $16 \times 3=48$	shows $x=5$ for both solutions	$x=5$ from 2 different equations.
