Question	Working	Answer	Mark	Notes
21		8600	P1 P1 P1 A1	for process to find the length of the rectangle, e.g. $24 \times 4 (= 96)$ for process to find the perpendicular height of an equilateral triangle of side (24×2) cm, e.g. $48\sin 60 (= 41.5(69..))$ or $\sqrt{48^2 - 24^2} (= 24\sqrt{3} \text{ oe})$ for complete process to find the width of rectangle, e.g. “ $41.5(69..)$ ” + $24 + 24 (= 89.5(69..))$ for answer in the range 8592 to 8602

Teacher clarification — Question 21

Original scheme

The height calculation labels the triangle side (24×2) cm.

Correction

The triangle side is (24×2) mm = 48 mm. All lengths in this calculation are in millimetres.

Reason

The radius is 24 mm. The final area remains 8600 mm squared, to 3 significant figures.
