Original wording

7.2 / 360 = 2.00 F

Correction / interpretation

For 100 g in Zurich: $7.2 / 360 * 100 = 2.00$ Swiss francs.

Reason

The Zurich 100 g entry omits multiplication by 100. Dividing 7.2 by 360 gives 0.02 Swiss francs per gram. The printed 2.00 Swiss francs and subsequent conversion to 1.60 pounds are correct for 100 g.

Original wording

$350 * 1.25 = 4.375$

Correction / interpretation

For London: $3.50 * 1.25 = 4.375$ Swiss francs; $4.375 / 200 = 0.021875$ Swiss francs per gram.

Reason

In the London by-weight entry, 350 is the price in pence, whereas 4.375 is a price in Swiss francs. As written, $350 * 1.25$ equals 437.5. Using 3.50 pounds gives the printed franc result and agrees with scheme page 7. Equivalently, 350 pence converts to 437.5 Swiss centimes.

Original wording

$720 / 360 = 0.02 \text{ F/g}$

Correction / interpretation

For Zurich: $7.20 / 360 = 0.02$ Swiss francs per gram; equivalently, $720 / 360 = 2$ Swiss centimes per gram.

Reason

The Zurich by-weight entry mixes centimes in the numerator with francs in the result. The printed rate of 0.02 Swiss francs per gram is correct when the numerator is 7.20 francs. Its subsequent conversion, $720 / 1.25 = 576$ pence and $576 / 360 = 1.6$ pence per gram, is consistent.
