

| Question | Answer | Mark | Mark scheme                                                                                                                                         | Additional guidance                                                                                                                        |
|----------|--------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 11       | (a)    | C1   | for a correct example, eg $3 \times 4 = 12$ or $12 \div 3 = 4$<br><b>or</b> a statement eg '3 is a factor of 12' or '1 is a factor of every number' | This may be seen, for example, in a factor tree or in a list of factors, but there must be no incorrect factors on the tree or in the list |
|          | (b)    | C1   | for an example, eg 23<br><b>or</b> a statement eg. 'the tens digit may be even' or 'the last digit only needs to be odd'                            |                                                                                                                                            |
