23	(a)		shown	M1	method to find at least one root in [0, 1], e.g. $2x^3 + 4x - 3$ (= 0) and f(0) (= –3), f(1) (= 3) oe or f(0) = 0 and f(1) = 6 since there is a change in sign there must be at least one root in $0 < x < 1$ (as f is continuous), or 0 and 6 are either side of 3
	(b)	$4x = 3 - 2x^3$ $x = \frac{3-2x^3}{4}$ $x = \frac{3}{4} - \frac{x^3}{2}$	shown	C1	for correct steps leading to rearranged equation
	(c)	$x_1 = 0.75$ $x_2 = 0.5390625$ $x_3 = 0.671677351$	0.671677351	M1 M1 A1	for one correct iteration for two further iterations for 0.671(677351)
