Question	Answer	Mark	Mark scheme	Additional guidance
13	$180 - \frac{1}{2}x$	M1	for identifying an unknown angle eg $AOC = 360 - x$, $ADC = \frac{1}{2}x$	Could be shown on the diagram alone
		A1	for $180 - \frac{1}{2}x$ oe	
		C1	(dep A1) full reasons for their method the angle at the centre of a circle is twice the angle at the circumference opposite angles of a cyclic quadrilateral add up to 180 **OR** angles at a point add up to 360 the angle at the centre of a circle is twice the angle at the circumference	Underlined words need to be shown; reasons need to be linked to their method; any reasons not linked do not credit.
