10 Solve the simultaneous equations

$$2x + 3y = 6$$
$$7x - 2y = 1$$

2 × first: $4x + 6y = 12$

3 × second: $21x - 6y = 3$

Add: $25x = 15$

$x = 15 \div 25 = 0.6$

$2(0.6) + 3y = 6$

$3y = 4.8, \quad y = 1.6$

$x = 0.6, \quad y = 1.6$

1 mark
Make opposite y coefficients.

1 mark
x = 0.6.

1 mark
Substitute into an original equation.

$x =$ .....

$y =$ .....

1 mark
Both values correct.

(Total for Question 10 is 4 marks)
