19 A fair dice is thrown n times.

Find an expression for the probability of getting at least one six in the n throws.

$P(\text{no sixes in } n \text{ throws}) = (5/6)^n$

$P(\text{at least one six}) = 1 - (5/6)^n$

2 marks total

Use the complement; independent throws multiply.

(Total for Question 19 is 2 marks)
