14 Expand and simplify $(6x + 3)(2x - 5)(7 - 4x)$

$(6x + 3)(2x - 5) = 12x^2 - 30x + 6x - 15$

1 mark
Expand the first two brackets, then collect like terms.

$= 12x^2 - 24x - 15$

$(12x^2 - 24x - 15)(7 - 4x)$

$= 84x^2 - 168x - 105 - 48x^3 + 96x^2 + 60x$

1 mark
Multiply each quadratic term by BOTH 7 and −4x.

$= -48x^3 + 180x^2 - 108x - 105$

.....

(Total for Question 14 is 3 marks)

1 mark
Collect all cubic, square, linear and constant terms.
