9 Jacqui wants to work out $3480 \div 5$

She knows that $3480 \div 10 = 348$

Jacqui writes $3480 \div 5 = 174$

because $10 \div 5 = 2$

and $348 \div 2 = 174$

What mistake did Jacqui make in her method?

She divided 348 by 2 instead of multiplying by 2.

Dividing by 5 gives twice as much as dividing by 10.

3480 ÷ 5 = 348 × 2 = 696

1 mark

Explain the incorrect division by 2

(Total for Question 9 is 1 mark)
