DO NOT WRITE IN THIS AREA

14 Sally plays two games against Martin.
In each game, Sally could win, draw or lose.

In each game they play,
the probability that Sally will win against Martin is 0.3
the probability that Sally will draw against Martin is 0.1

Work out the probability that Sally will win **exactly** one of the two games against Martin.

P(not win) = 1 – 0.3 = 0.7.

Exactly one win: W,N or N,W.

0.3 × 0.7 + 0.7 × 0.3 = 0.42.

3 marks total
One win-then-not path
Both possible orders
0.42

(Total for Question 14 is 3 marks)
