15 Show that $\frac{4x+3}{2x} + \frac{3}{5}$ can be written in the form $\frac{ax+b}{cx}$ where a, b and c are integers.

Common denominator: 10x

(4x + 3)/(2x) = 5(4x + 3)/(10x)

3/5 = 6x/(10x)

Sum = [5(4x + 3) + 6x]/(10x)

= (26x + 15)/(10x)

1 mark
rewrite with denominator 10x

1 mark
combine numerators

1 mark
a=26, b=15, c=10

(Total for Question 15 is 3 marks)
