Original wording

The first frequency-density calculation prints 20 divided by 28 equals 0.8.

Correction / interpretation

For the first class $0 < t <= 25$, the class width is 25, so frequency density = 20 / 25 = 0.8. The source divisor 28 is a misprint; the stated density 0.8 and the remaining densities 1.75, 3, 5.8, 1 and 0.8 are correct.

Reason

Frequency density is frequency divided by the actual class width.
