Question	Answer	Mark	Mark scheme	Additional guidance
22	Proof	M1	for angle $ABE = 180 - x$ and Opposite angles of a cyclic quadrilateral add up to 180	Working and reason both needed for the award of marks Accept equivalent answers where angles are not expressed in terms of x.
		M1	for angle $EBC = x$ and Angles on a straight line add up to 180	Award the first 2 marks for angle $EBC = x$ and the exterior angle of a cyclic quadriltateral is equal to the opposite interior angle
		M1	for angle $CDE = 180 - x$ and Opposite angles of a cyclic quadrilateral add up to 180	
		C1	for stating angle CDE + angle $AFE = 180$ or that angles are allied/co-interior leading to statement of result **or** for stating the angle between FED extended and DC is x and Angles on a straight line add up to 180 so result follows since angles AFE and the angle between FED extended and DC are corresponding.	Can only be awarded if correct reasons given at every stage
