Original wording

Integer > 21

Correction / interpretation

A positive integer greater than 21 satisfies the inequality. As the question says integer without restricting the sign, any negative integer also makes 2/7 > 6/N true. Zero is excluded because division by zero is undefined.

Reason

For N positive, cross multiplication gives N > 21. For N negative, 6/N is negative while 2/7 is positive. Retain valid explanations for either case.
