21				4	C1 draws AO and OC and considers angles around the point O (algebraic notation may be used, e.g. angles labelled x and y) C1 uses "angle at centre..." to find angle ABC (e.g. $\frac{1}{2}x$) or angle ADC (e.g. $\frac{1}{2}y$) C1 for $ABC + ADC = \frac{1}{2}x + \frac{1}{2}y$ C1 complete proof with all reasons given, e.g. angles at a point add up to 360°, the angle at the centre of a circle is twice the angle at the circumference NB: do **not** accept "opposite angles of a cyclic quadrilateral add up to 180°"
