11 Here are two rectangles.

A

B

The length of rectangle **B** is 25% greater than the length of rectangle **A**.

The width of rectangle **B** is $\frac{3}{5}\times$ the width of rectangle **A**.

Find the fraction $\frac{\text{area of rectangle } \mathbf{B}}{\text{area of rectangle } \mathbf{A}}$

Give your answer in its simplest form.

Let A have length L and width W.

B has length 1.25L and width 0.6W.

1 mark
Convert both linear factors.

Area B = 1.25L × 0.6W = 0.75LW

1 mark
Multiply the two factors.

Area B ÷ Area A = 0.75 = $\frac{3}{4}$

1 mark
Simplest fraction 3/4.
