3 The table shows information about the distances travelled by 50 new cars before a tyre was changed.

Distance (d km)	Number of cars
$5000 \leqslant d < 25\,000$	9
$25\,000 \leqslant d < 45\,000$	25
$45\,000 \leqslant d < 65\,000$	16

Calculate an estimate for the mean distance.

$15000 \times 9 + 35000 \times 25 + 55000 \times 16$

$= 135000 + 875000 + 880000 = 1890000$

Mean $= 1890000 \div 50 = 37800$ km

1 mark
Use class midpoints.

1 mark
Total fx ÷ 50.

.....km

1 mark
37800 km.

(Total for Question 3 is 3 marks)
