7 Point A has coordinates $(-4, 2)$

Point A is translated to the point with coordinates $(-1, -3)$

Find, as a column vector, the vector that describes this translation.

Horizontal change = -1 - (-4) = 3

1 mark
New coordinate minus old.

Vertical change = -3 - 2 = -5

$$\begin{pmatrix} 3 \\ -5 \end{pmatrix}$$

1 mark
Column vector: 3 right and 5 down.

(Total for Question 7 is 2 marks)
