25 A company's profit of £18 000 is shared by 2 directors and 24 employees.

$\frac{1}{3}$ of the profit is shared equally between the 2 directors of the company.
The rest of the profit is shared equally between the 24 employees of the company.

The amount each director gets = $n \times$ the amount each employee gets.

Work out the value of n.
You must show how you get your answer.

Directors' total = £18 000 ÷ 3 = £6000

1 mark
Divide the directors' third equally between two.

Each director = £6000 ÷ 2 = £3000

Employees' total = £18 000 – £6000 = £12 000

1 mark
Find the remaining profit.

Each employee = £12 000 ÷ 24 = £500

1 mark
Divide it between 24 employees.

n = £3000 ÷ £500 = 6

1 mark
Find the multiplier, director share ÷ employee share.

$n =$ 6

(Total for Question 25 is 4 marks)
