24 (a) Write 174 million in standard form.

$174\,000\,000 = 1.74 \times 10^8$

1.74×10^8

2 marks total
1.74 is between 1 and 10; move eight places.

(2)

Mark is going to put some paper in his printer.

Each sheet of paper is 8.5×10^{-3} cm thick.
The paper tray of Mark's printer has a depth of 30 mm.

(b) Show that Mark can fit more than 350 sheets of paper in the tray.

30 mm = 3 cm; one sheet = 0.0085 cm

350 sheets: $350 \times 0.0085 = 2.975$ cm

$2.975 < 3$, so more than 350 sheets fit.

2 marks total
Compare the thickness with the tray in the same units.

(2)

(Total for Question 24 is 4 marks)
