22

Triangle **A** is transformed by a combined transformation of a reflection in the line $y = -x$ followed by a rotation.

Under the combined transformation, two of the vertices of the triangle are invariant.

Describe fully one possible rotation.

Rotation 90° anticlockwise about (−2, 2).

Combined map: (x, y) → (x, 4 − y).

Thus (3, 2) and (4, 2) stay fixed.

2 marks total
Reflection in y = −x, then this rotation, fixes the two vertices on y = 2.
