27 A shape is made using 4 identical rectangles.

Find the perimeter of the shape.

Let each rectangle have length l and width w.

$2l + w = 24$; $2l - w = 16$

1 mark
Translate BOTH given dimensions.

Add: $4l = 40$, so $l = 10$ cm

$w = 24 - 20 = 4$ cm

1 mark
Solve for the rectangle dimensions.

Four separate perimeters: $4 \times 2(10 + 4) = 112$

Three shared edges of 4 cm are each counted twice.

Perimeter = $112 - 2 \times 3 \times 4 = 88$ cm

2 marks total
Remove the internal shared edges from the perimeter.

.....88..... cm

(Total for Question 27 is 4 marks)
