10 A is the point with coordinates $(-2, -1)$
B is the point with coordinates $(1, 3)$

Line **L** passes through the points A and B.
Line **M** has equation $3y - 2x = 4$

Is line **L** parallel to line **M**?
You must show how you get your answer.

Gradient L = rise ÷ run

$$\frac{3 - (-1)}{1 - (-2)} = \frac{4}{3}$$

1 mark
Use the same coordinate order in both differences.

Line M: 3y – 2x = 4

1 mark
Rearrange to y = mx + c.

3y = 2x + 4

Gradient M = 2/3. Therefore No: 4/3 ≠ 2/3.

1 mark
Parallel lines must have equal gradients.

(Total for Question 10 is 3 marks)
