9 The table gives information about the money 51 people spent on meals one day.

Money spent (£M)	Frequency
$0 < M \leqslant 5$	2
$5 < M \leqslant 10$	5
$10 < M \leqslant 15$	15
$15 < M \leqslant 20$	12
$20 < M \leqslant 25$	11
$25 < M \leqslant 30$	6

(a) On the grid, draw a frequency polygon for this information.

2 marks total
Plot class midpoints against frequency; join with straight segments.

(2)

(b) Find the class interval that contains the median.

Median position = (51 + 1) ÷ 2 = 26th

Cumulative frequencies: 2, 7, 22, 34, 45, 51

15 < M ≤ 20

(1)

1 mark
The 26th value is after 22 and at or before 34.

Terry says,

"At least one of these people spent £30"

(c) Is Terry correct?
Give a reason for your answer.

We cannot tell. The final class is $25 < M \leq 30$.

All six people could have spent less than £30.

The grouped table does not give exact individual amounts.

(1)

1 mark

Being in the last class does not prove anyone spent its upper endpoint.

(Total for Question 9 is 4 marks)
