4 Ken buys some fruit.

He buys apples, bananas, peaches and oranges.
Ken buys

4 apples	weighing 125 g each
2 bananas	weighing 170 g each
3 peaches	weighing 135 g each

Each orange has a weight of 90 g.

The fruit has a total weight of 1.785 kg.

(a) Work out how many oranges Ken buys.

Apples: 4 × 125 = 500 g

Bananas: 2 × 170 = 340 g

Peaches: 3 × 135 = 405 g

1.785 kg = 1785 g; known fruit = 1245 g.

Oranges weigh 1785 – 1245 = 540 g.

Number of oranges = 540 ÷ 90 = 6

1 mark
Find the weight of a fruit type

1 mark
Subtract all the known fruit

6

1 mark
Correct number of oranges

(3)

Jane wants to buy 15 tomatoes.
She asks for 1 kg of tomatoes at a shop.
Jane assumes that each tomato has a weight of 75 g.

(b) (i) If Jane's assumption is correct, will she get 15 tomatoes?
You must show how you get your answer.

15 × 75 = 1125 g = 1.125 kg

No. 1125 g > 1000 g, so 1 kg is not enough.

1 mark
Find the weight of 15 tomatoes

1 mark
No, supported by the comparison

(2)

(ii) If Jane's assumption is **not** correct, could she get 15 tomatoes?
Justify your answer.

Yes, if the tomatoes are light enough. For example,

15 tomatoes at 60 g each weigh only 900 g.

1 mark
Lighter tomatoes could give at least 15 in 1 kg
