10 (a) Simplify $\dfrac{x-1}{5(x-1)^2}$

$$\frac{\cancel{x-1}}{5\cancel{(x-1)}(x-1)} = \frac{1}{5(x-1)}$$

One factor $x - 1$ remains in the denominator.

1 mark
Cancel one common factor; $x \neq 1$

(1)

(b) Factorise fully $50 - 2y^2$

$50 - 2y^2 = 2(25 - y^2)$

HCF: 2 | 25 | $-y^2$

2	50	$-2y^2$

$25 - y^2 = (5 + y)(5 - y)$

1 mark
Take out the common factor 2

$2(5 + y)(5 - y)$

(2)

1 mark
Finish with the difference of two squares

(Total for Question 10 is 3 marks)
