14 Victoria throws an ordinary fair 6-sided dice once.

She says,

"The probability of getting a 3 is half the probability of getting a 6"

(a) Is Victoria correct?
You must explain your answer.

No. Each is one equally likely outcome out of six.

1 mark
Both faces have equal probability

(1)

Andy throws the dice twice.
He says,

"The probability of getting a 6 on both throws is $\frac{2}{6}$"

(b) Is Andy correct?
You must explain your answer.

No: $\frac{1}{6} \times \frac{1}{6} = \frac{1}{36}$

1 mark
Multiply the two probabilities

(1)

Indre throws the dice once.
She also throws a coin to get Heads or Tails.

(c) List all the possible outcomes she can get.

1H, 2H, 3H, 4H, 5H, 6H

1T, 2T, 3T, 4T, 5T, 6T

2 marks total
All 12 outcomes; no extras or repeats

(2)

(Total for Question 14 is 4 marks)
