12 $T = \frac{q}{2} + 5$

Here is Spencer's method to make q the subject of the formula.

$$2 \times T = q + 5$$

$$q = 2T - 5$$

What mistake did Spencer make in the first line of his method?

He multiplied q/2 by 2 but did not multiply 5 by 2.

Correct: 2T = q + 10, hence q = 2T – 10.

1 mark
The 5 must also be doubled

(Total for Question 12 is 1 mark)
