21 When a biased coin is thrown 4 times, the probability of getting 4 heads is $\frac{16}{81}$

Work out the probability of getting 4 tails when the coin is thrown 4 times.

$P(H)^4 = 16/81 = (2/3)^4$.

So $P(H) = 2/3$ and $P(T) = 1/3$.

$P(4\ tails) = (1/3)^4 = 1/81$.

2 marks total
One-tail probability
Four tails = 1/81

(Total for Question 21 is 2 marks)
