13		Proof	M1	for 3 consecutive integers written algebraically, e.g. n, $n + 1$, $n + 2$ **or** $n - 1$, n, $n + 1$
			M1	for multiplying the smallest and largest, e.g. $n(n + 2) = n^2 + 2n$ **or** $(n - 1)(n + 1) = n^2 - 1$ **or** for squaring the middle number
			C1	for a correct conclusion from correct expressions

Original wording

The task says any three consecutive whole numbers.

Correction / interpretation

The intended identity is (k+1)^2 - 1 = k(k+2), so each non-zero outer number is a factor. The usual divisibility interpretation assumes positive consecutive numbers: if whole numbers includes 0, the triple 0,1,2 needs a qualification because 0 is not normally used as a divisor. The identity and intended algebraic proof remain valid.

Reason

Record the zero-boundary wording issue while retaining the original task and scheme.
