20	$x = -1.5, y = -1$ $x = 4, y = 10$	M1	for eliminating one variable, eg $2x + 2 = 2x^2 - 3x - 10$	
		M1	(dep) for rearranging to get a quadratic (= 0) in one variable	Condone missing "= 0"
		M1	use of factorisation or correct substitution into quadratic formula or completing the square to solve an equation of the form $ax^2 + bx + c = 0$	Condone missing "= 0" Method used must be complete but can contain some error.
		A1	$x = -1.5$, $x = 4$ **or** $y = -1$, $y = 10$	
		C1	$x = -1.5$, $y = -1$ and $x = 4$, $y = 10$ correctly matched x and y values
