15 The graph gives the volume of water, in litres, in a container at time t seconds after the water started to flow out of the container.

Using the graph, work out an estimate for the rate at which the water is flowing out of the container when $t = 12$
You must show your working.

Tangent at t=12: roughly (5,22) to (29,2).

Gradient ≈ (2−22)/(29−5) ≈ −0.83

Outflow rate ≈ 0.83 litres/s.

1 mark
tangent at t=12

1 mark
rise ÷ run of tangent

1 mark
rate 0.7 to 1.1

0.83 litres per second

(Total for Question 15 is 3 marks)
